

AI POWERED MIGRATION ACCELERATOR

Business Challenge

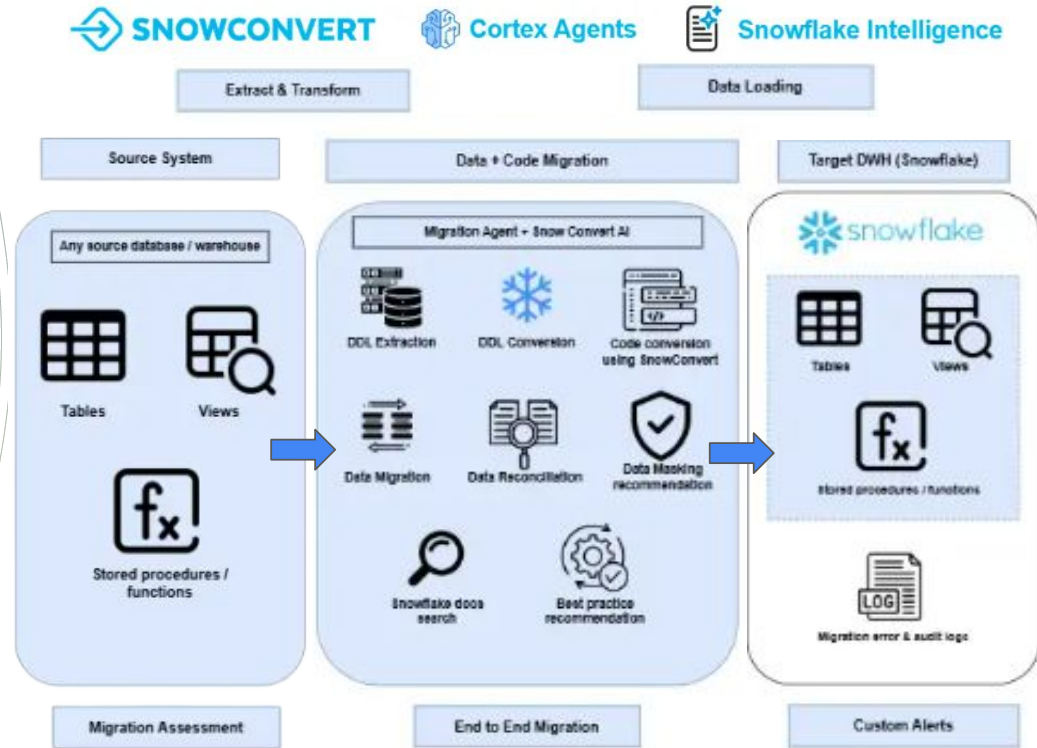

Migrating from legacy data warehouses to Snowflake is highly manual and complex. Security, auditing, validation, and monitoring require significant effort, increasing the risk of errors and delays while limiting visibility across the migration process.

Solution

Kipi.ai's Migration Accelerator combines Cortex Agents with SnowConvert AI to automate schema conversion, data movement, validation, and reconciliation. The platform supports secure migration of data and code through a centralized UI with encryption, audit logging, automated testing, and incremental CDC.

Impact

The automated approach reduces manual conversion effort, proactively detects issues, and provides end-to-end visibility through a central command interface. Customers achieve up to 75% faster migrations, lower delivery risk, and a smoother cutover to Snowflake.

MULTI-AGENT ARCHITECTURE: PARALLEL DATA MIGRATION ORCHESTRATION

MASTER AGENT (CORE ORCHESTRATOR)

Role: Central coordination and parallel execution management.
Single tool: Agent-as-a-Tool used to invoke sub-agents.

AGENT-AS-A-TOOL (DATA MIGRATION AGENT CALLER)

PARALLEL EXECUTION:
Master Agent spawns multiple instances for concurrent migration of different tables.

DATA MIGRATION AGENT (SUB-AGENT INSTANCE)
